

# About KM Biologics

KM Biologics Co.,Ltd contributes to people's health through the development and supply of vaccines and other pharmaceuticals products. Due to the effects of the new coronavirus infection, which is still prevalent, people's interest in vaccines has increased. Vaccines play a role in preventing infectious diseases and even the loss of life. Every year, many children around the world experience severe symptoms and pass away from vaccine-preventable diseases (VPD). If many people get vaccinated, the population acquires immunity, and it becomes possible to halt the transmission of the disease. It also protects people who cannot be vaccinated from the risk of infectious diseases.

At KM Biologics, we offer ideas that will make you want to learn more about VPD and provide information about vaccines for parents and children.

We welcome your diverse ideas on how we can help people acquire the correct information about VPDS and vaccines and make them say “I’m glad I got the vaccine.”

Such ideas can take many forms, including educational tools like picture books or apps, which emphasize the benefits of vaccination, or mechanisms designed to motivate people to proactively seek vaccination.
